AQLI Air Quality Life Index®

Guatemala Fact Sheet

Guatemala is the most polluted country in North America and the 16th most polluted country in the world. Fine particulate air pollution ($PM_{2.5}$) shortens the average Guatemalan resident's life expectancy by 2.4 years, relative to what it would be if the World Health Organization (WHO) guideline of 5µg/m³ was met.[1] Some areas of Guatemala fare much worse than average, with air pollution shortening lives by 4.4 years in Mixco, the country's most polluted municipality in the Guatemala department.

KEY TAKEAWAYS

- All of Guatemala's 17.4 million people live in areas where the annual average particulate pollution level exceeds the WHO guideline. Despite a high health burden due to particulate pollution, the country does not have a national standard.
- Measured in terms of life expectancy, particulate pollution takes 2.4 years off the life of the average Guatemalan resident. In contrast, cancer (neoplasms) reduces the average life expectancy by 2.2 years.
- Particulate pollution has increased over time. From 1999 to 2021, average annual particulate pollution increased by 37.2 percent, further reducing life expectancy by more than 9 months.
- In the most polluted departments of the country—Sacatepequez, Guatemala and Chimaltenango—a combined 4.6 million residents or 26.5 percent of Guatemala's population are on track to lose between 3.1 to 4.1 years of life expectancy on average relative to the WHO guideline if the current pollution levels persist.
- If the country were to reduce particulate pollution to meet the WHO guideline, the 3.5 million residents in Guatemala department—the capital of Guatemala—would gain 10.8 million total life years.

Figure 1 · Potential gain in life expectancy from permanently reducing $PM_{2.5}$ from 2021 concentration to the WHO guideline

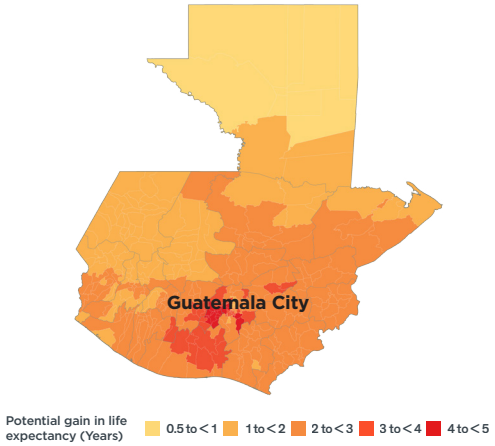

Figure 2 · Potential gain in life expectancy from reducing $PM_{2.5}$ from 2021 levels to the WHO guideline in all provinces of Guatemala

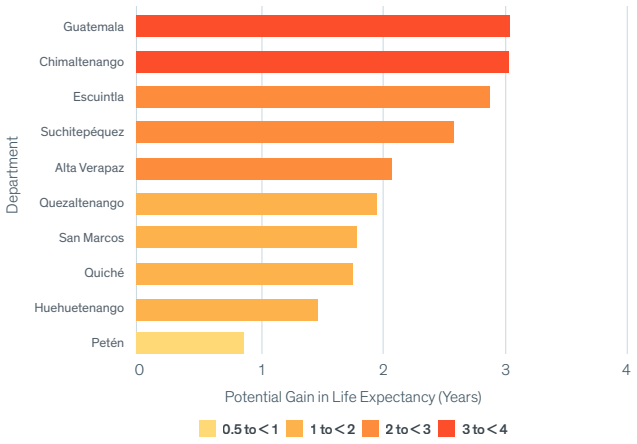
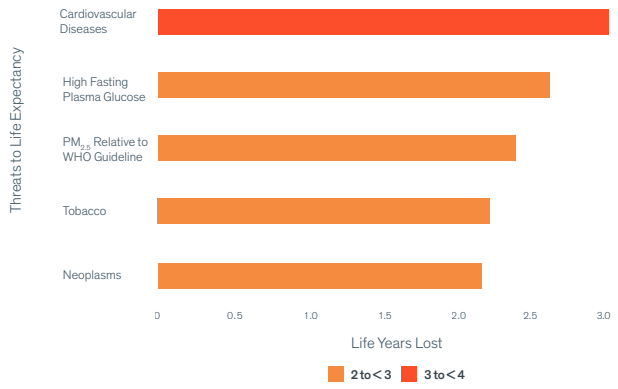


1 This data is based on the AQLI 2021 dataset. All annual average $PM_{2.5}$ values (measured in micrograms per cubic meter: µg/m³) are population weighted.

Potential life expectancy impacts of particulate pollution reductions in the 25 most populous municipalities of Guatemala

Municipality	Population (hundred thousands)	Annual average 2021 $PM_{2.5}$ concentration ($\mu g/m^3$)	Life expectancy gains from reducing $PM_{2.5}$ from 2021 concentration to WHO $PM_{2.5}$ guideline of 5 $\mu g/m$ (years)	Life expectancy gains from reducing $PM_{2.5}$ from 2021 concentration by 30 percent (years)
Mixco	5.5	50.3	4.4	1.5
Villa Nueva	5.3	28.1	2.3	0.8
San Pedro Carchá	2.7	25.6	2	0.8
San Juan Sacatepéquez	2.5	38.5	3.3	1.1
Cobán	2.2	27	2.2	0.8
Quetzaltenango	2	26.6	2.1	0.8
Jalapa	1.9	31.3	2.6	0.9
Escuintla	1.8	41.6	3.6	1.2
Petapa	1.7	24.4	1.9	0.7
Jutiapa	1.7	27	2.2	0.8
Chichicastenango	1.6	26.3	2.1	0.8
Chisec	1.5	22.5	1.7	0.7
Santa Lucía Cotzumalguapa	1.3	39	3.3	1.1
Panzós	1.3	32.2	2.7	0.9
Villa Canales	1.3	30.5	2.5	0.9
Chiquimula	1.3	32.2	2.7	0.9
Amatitlán	1.3	31.1	2.6	0.9
Santa Cruz Barillas	1.3	22.3	1.7	0.7
Chinautla	1.3	24.2	1.9	0.7
Coatepeque	1.3	26.5	2.1	0.8
La Libertad	1.3	12.3	0.7	0.4
Totonicapán	1.3	26.4	2.1	0.8
Momostenango	1.3	20.4	1.5	0.6
Sayaxché	1.2	15.8	1.1	0.5
Chimaltenango	1.2	43.5	3.8	1.3

Figure 3 · Top 5 threats to life expectancy in Guatemala



Sources: Global Burden of Disease (https://vizhub.healthdata.org/gbd-results/) level-2 causes and risks data and WHO Life Tables (https://apps.who.int/gho/data/node.main.LIFECOUNTRY?lang=en) were combined with the Life table method to arrive at these results. "$PM_{2.5}$ relative to WHO Guideline' bar displays the reduction in life expectancy relative to the WHO guideline as calculated by latest AQLI (2021) data.

ABOUT THE AIR QUALITY LIFE INDEX (AQLI)

The AQLI is a pollution index that translates particulate air pollution into perhaps the most important metric that exists: its impact on life expectancy. Developed by the University of Chicago's Milton Friedman Distinguished Service Professor in Economics Michael Greenstone and his team at the Energy Policy Institute at the University of Chicago (EPIC), the AQLI is rooted in research that quantifies the causal relationship between long-term human exposure to air pollution and life expectancy. The Index then combines this research with hyper-localized, satellite measurements of global particulate matter ($PM_{2.5}$), yielding unprecedented insight into the true cost of pollution in communities around the world. The Index also illustrates how air pollution policies can increase life expectancy when they meet the World Health Organization's guideline for what is considered a safe level of exposure, existing national air quality standards, or user-defined air quality levels. This information can help to inform local communities and policymakers about the importance of air pollution policies in concrete terms.

Methodology: The life expectancy calculations made by the AQLI are based on a pair of peer-reviewed studies, Chen et al. (2013) and Ebenstein et al. (2017), co-authored by Michael Greenstone, that exploit a unique natural experiment in China. By comparing two subgroups of the population that experienced prolonged exposure to different levels of particulate air pollution, the studies were able to plausibly isolate the effect of particulate air pollution from other factors that affect health. Ebenstein et al. (2017) found that sustained exposure to an additional 10 $\mu g/m^3$ of PM_{10} reduces life expectancy by 0.64 years. In terms of $PM_{2.5}$, this translates to the relationship that an additional 10 $\mu g/m^3$ of $PM_{2.5}$ reduces life expectancy by 0.98 years. This metric is then combined with sea-salt and mineral dust removed satellite-derived $PM_{2.5}$ data. All 2021 annual average $PM_{2.5}$ values are population-weighted and AQLI's source of population data is https://landscan.ornl.gov/. We are grateful to the Atmospheric Composition Analysis Group, based at the Washington University in St. Louis for providing us with the satellite data. The original dataset can be found here: https://sites.wustl.edu/acag/datasets/surface-pm2-5/.
